TOLERANCES AND MACHINING ALLOWANCES

EN 10060

The reported allowances are valid for lengths up to 1000 mm; for higher lengths, consider also straightness deviation according to standards.

a = thickness allowance
b, l = dimensions after machining
B, L = raw material dimensions

a the value must be higher than D class value; prescriptions and checking method should be agreed.				

If it is not possible to check the total delivery lot, special agreements shall be made with regard to the maximum admissible portion z of defective material;
e.g. z = 2,5%

SEP 1921

Values applicable to forged, hot-rolled, raw or processed steel bars in alloyed or non-alloyed steels, both in their natural state and treated condition.

Internal defects checking is carried out at supplier discretion (instrumentation, 1-4 MHz probes, coupling methods, etc.), as long as it is carried out on the entire volume of products.

Defect recording is based on the F.B.H. (flat-bottom-hole) method.

Values higher than the reported ones should be described according to their position, size, extension, then schematized and sent to Lucefin technical department for evaluation.

ADMISSIBILITY LIMITS - TABLE 1
